#### 1 Introduction

The gaming industry in this day and age is thriving and consistently expanding. Barring some catastrophic event, the industry will soon be worth over 200 billion dollars(Gough, 2019). With early one third of the World actively gaming, the future of the industry is bright. The large community and potential profits have allowed anyone and everyone a way in. There are multitude of developers, as well as platforms for which games can be produced. From designated gaming consoles like Sony's PS4 or Nintendo's DS, to PC's and mobile phones. As a result, thousands of games are released every year (Gough, 2019). On a game distributer for PC called Stream, 9050 games were published in 2018 (Gough, 2019). That was just for PC, the Google Play store, which is only available on android devices, saw an increase of nearly 100,000 in the amount of games in the year 2017(Gough, 2019).

While games developed for mobile, the browser, and the like can be completed in a relatively short amount of time, that is not always the case. Years upon years of development can be spent on games that are developed mainly for consoles and the PC. To build anticipation, publishers routinely announce upcoming project and release brief details; this can happen long before the release date. In the years in between, gamers may struggle to keep of all the information released on a game that interest them.

On the other hand, if the news on about a pending release dwindles, gamers may forget completely. This can really affect small independent developers. Without the marketing dollars, they can struggle to maintain interest when they have to fund their development as well. As if the amount of information before the release wasn't enough, more often than not, there is more after the release. This is because of the countless updates/bug-fixes/ and other news-worthy changes that are made to a game. The amount of information is not the only problem, there are also too many sources. Sites like: Twitter, Facebook, and Reddit (which has subreddits devoted

to specific games) all could contain relevant information. Not to mention the news sites which are specifically devoted to gaming, i.e. Game Informer. The spread of information across many mediums poses an additional challenge to gamers. When time and effort are the focal point in gathering gaming information, the tools and methods currently available don't suffice.

## **Solution Description**

The solution is GameEye, an aggregator for gaming news. Users will be able to search for and track their favorite games. After searching for the game, users have the option to add it to their personal watchlist. When news is released, GameEye will alert the user. GameEye will not only collect, but also analyze the data it gathers. With the use of machine learning, articles and tweets are categorized based on their subject matter. The articles and tweets will be given a score on their importance, judged by a multitude of factors.

## 2 Game Eye Product Description

GameEye is a cross-platform web application available for desktop and mobile. It collects, organizes, and display users with the latest gamin news. The news is tailored to their game interest, and displayed as part of six categories: important updates, news articles, tweets, Reddit posts, images, and videos. After scouring the web for new game content, GameEye uses artificial intelligence to categorize what it found. To

#### 2.1 Key Product Features and Capabilities

#### General

By developing GameEye using PWA(Progressive Webs App) technology, cross-platform use across desktop and mobile is achieved. This allows for offline support, coupled with a local cache allows game information to be displayed when offline. In addition, methods to help mitigate connectivity interruption.

#### **Authentication**

GameEye uses authentication architectures to provide the user with a secure experience registering and logging in. An account used on external sites can be used to register as well. A user's session will persistent after exiting the app, so that repeated logins aren't necessary. Two-factor authentication ensures that user logins are genuine. And in the event that a user forgets their password, a method of recovery is available.

#### **Account Management**

After creating an account, users have the ability to change their password and profile details. In the event they want to delete their account, that is available.

## **Game Tracking**

Each user will have a personal watch list consisting of games they selected to follow. Games currently being followed will be displayed on the watchlist tab along with a thumbnail of the game. Game Eye will monitor the games on the watchlist, classifying new content it retrieves by important updates, news articles, tweets, Reddit posts, images, and videos. Thumbnails for news articles and tweets will be included. In an effort to introduce new games into a users watchlist, GameEye will display a list of the most-watched games on their desired platform.

## Searching

In order to fill their watchlist, the user is able to search for video game titles. The search bar is located in the Watchlist tab and has autocompletion. Aside from saving some time, users will be able to find games easier if they are unsure of its name.

## **Web Scraping**

To provide relevant news to the user, GameEye uses Web Scraping. Web Scraping is a systematic way to gather data from websites and export it into a useable file. The data gathered

will be classified into one of five categories: news articles, reddit post from designated subreddits, tweets from trustworthy twitter feeds, YouTube videos from designated game

accounts, and images.

**Notifications** 

Push notifications are available for both mobile and desktop to alert users about game

updates. Users will be able to see the number of notifications for a certain category (i.e. tweets or

news articles). GameEye also suggest notifying users of game updates on the most-watched list.

**Settings** 

GameEye allows users to choose whether or not they want to: see archived resources, see

importance scores of articles or tweets, and if they want notifications at all. The user also has the

option to submit feedback.

**Machine Learning** 

To automate the resource collection, GameEye uses machine learning in conjunction with

web scraping. The interface is provided with labeled data it can learn from. This allows for the

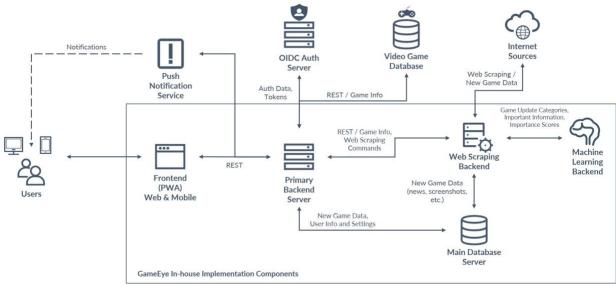

data collected from web scraping to be classified (release date announcement, delay, major game

update, minor game update, etc.). In addition, the machine learning interface will be responsible

extracting information out of articles and tweets, as well as scoring its importance.

[This space is left blank]

## 2.2 Major Components Hardware/Software)

MFCD Figure 1

#### Hardware

GameEye is comprised of five hardware components: frontend sever, main backend server, webscraping backend server, machine learning backend server, and the main database server.

The **frontend** sever is responsible for what is displayed to the user on the mobile/desktop application.

The **main backend** uses REST API to manage interactions between the other servers.

Works with the web scraping backend to gather necessary for the frontend to be meaningful

The **webscraping backend** server scours the web with operations run by REST API. It provides the data for the machine learning backend.

The **machine learning backend** uses a REST API so that a machine learning interface can be run. Works with the webscraping backend so that it stores the correct information.

The **main database server** is provided by MongoDB and it contains all of the application data.

#### Software

#### **Frontend**

WebStorm is the developmental environment that will be used to program the frontend. Angular framework allows GameEye to be developed efficiently as a single-paged application. Angular incorporates: HTML, CSS/SASS, and TypeScript. Google Workbox PWA libraries will be used provide offline support.

#### Backend

IntelliJ IDEA is the development environment that will be used to program the backend. Spring framework will be used to build the backend java application. Jsoup is an HTML parser will be used to webscrape. MongoDB Java driver allows for communication with the MongoDB sever.

## **Testing**

Jest JavaScript Framework will be used to test the front nd. Junit Java Framework will be used to test on the backend.

## **Machine Learning**

- 1. Python
- 2. Keras (deep learning library)
- 3. scikit-learn library
- 4. TensorFlow Serving (model server)

#### **Natural Language Processing**

- 1. Python
- 2. spaCy library

#### **Databases**

- 1. MongoDB
- 2. MongoDB Compass (MongoDB GUI)
- 3. IGDB REST API

#### **Third Party Software**

- 1. Auth0 Single Page App SDK
- 2. Firebase Cloud Messaging (using Firebase Admin Java SDK)

#### 3 Identification of Case Study

GameEye is an application to keep gamers up-to-date with the news on the games they are interested in. It serves a funnel, collecting data from sources all over the internet displaying it on one application for the user. Gamers use GameEye to track they games are interested in, and receive update notification when news breaks. In the future, generation of gamers too young now, will use GameEye in the future.

## **4 Game Product Prototype Description**

#### **4.1 Prototype Architecture (Hardware/Software)**

The prototype will utilize the same architecture as the real-world product except for the replicated servers for load balancing that would be present in the real-world product.

Figure 2: RWP vs Prototype Features

## **4.3 Prototype Development Challenges**

The first challenge is learning the language and frameworks necessary develop the application, and how they will be incorporated. Teaching the machine learning models will also be a challenge, a sufficient amount of data is needed to ensure its accuracy. Since the backend has multiple servers, it will take effort getting them to function together. To provide connectivity interruption resiliency, a cache must be implemented for data on the frontend. Webscraping needs to be flexible, as not to cause errors if a site changes in the future.

[This space is left blank intentionally]

## **5** Glossary

Angular Framework: Platform for building mobile and desktop applications.

**API**: Application Programming Interface; a set of functions and procedures allowing the creation of applications that access the features or data of an operating system, application, or other services.

AWS: Amazon® subsidiary that provides on-demand cloud computing platforms and APIs

CSS: Cascading Style Sheets; used to stylize webpages.

Guest: Initial role for users who have not created an account on GameEye.

*Hitlist*: List of highly watched video games by users.

**HTML:** Hypertext Markup Language; used as markup for documents meant to be displayed in a web browser.

*IGDB*: Database of known video games, accessed by REST API to populate GameEye's database

*Indie Games*: Games developed by individuals or smaller teams of people without the financial support of larger game publishers.

*IntelliJ Idea*: IDE developed by JetBrains to write Java applications and will be used in the back-end development of GameEye.

JavaScript: Object-oriented language used to create dynamic, interactive effects on webpages.

Jest JavaScript Framework: Testing framework maintained by Facebook Inc.

**JSoup Library:** Java library for working with real-world HTML.

JUnit Java Framework: A testing framework for Java.

Keras (Python Deep Learning Library): Open-source neural-network library written in Python.

*MongoDB*: A cross-platform document-oriented database program

**Noise Filtering:** Information/news articles shown that caters to an individual's content preferences.

*OIDC Authentication:* Authentication protocol based on the OAuth2.0 family of specifications.

**PWA**: Progressive Web Application; a type of application software delivered through the web which is built using common web technologies including HTML, CSS, and JavaScript.

*Python*: Interpreted, high-level, general-purpose programming language.

**REST:** Software architectural style used in creating web services.

**RSS Feed:** Web feed that allows users and applications to access updates to websites in a standardized, computer-readable format.

Scikit-learn Library: Software machine learning library for the Python programming language.

SpaCy Library: Open-source software library for advanced natural language processing.

*Spring Framework*: Application framework and inversion of control container for the Java platform.

*Tester*: GameEye beta testers; users of the application in its prototype phase who will provide feedback on their experience.

Web Scraping: Data scraping for extracting data from websites.

WebStorm: IDE developed by JetBrains to write JavaScript code.
